Dedicated software for the design of low voltage electrical installations

Number of units in parallel : 1

Unit power (kVA): 400

Short circuit voltage (%): 4.0

Rated Voltage (V): 410

Transformer total losses (kW): 4.96

Coupling: Delta - Star

HV grid Short-Circuit Power

SkQmax (MVA): 200

Maximum cross section of aluminum : 300

Inserting single conductor ribbon cables multicore cables: allowed disallowed

Minimum phase section of copper: 1.5

Maximum cross section of copper: 300

Minimum cross section of aluminum: 10

Maximum cross section of aluminum: 300

Parallel Multicore cables: allowed disallowed

Calculation conditions

Maximum number of cables available when calculating section: 4

Inserting cables to several layers allowed: Yes No

Existence of potentially explosive locals: Yes No

Use of mineral insulated cables allowed: Yes No

Using insulated conductors or cables with allowed elevated core temperature: Yes No

Core type allowed: Copper and aluminum Copper only Aluminum only

Definition of symmetry factor: Always equal to 1 Equal to 1, only for pair settings Entered, regardless of the setting

Appearance threshold (A): 200

Identical temperatures throughout the installation: Yes No

COMPLETE AND EFFECTIVE

SEE Calculation was designed to quickly and efficiently handle any type of low voltage electrical installation, up to 1000V, whatever the level of complexity. It calculates conductors cross-sections, voltage drops, short-circuit currents, and sizes sources and protection, etc.

SEE Calculation takes into account, in real-time, the source configuration and operation, manages the protection selectivity and back-up, takes into account potentially explosive areas, mineral insulated cables, and allows the calculation to start from a given value of short circuit current (IK).

OPEN

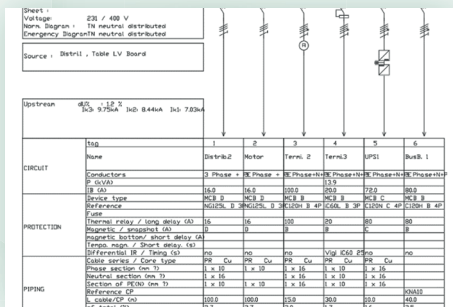

SEE Calculation is delivered with multi-manufacturers protection data base including (ABB, Gewiss, Hager, Legrand, Moeller, Schneider Electric, Siemens, and more), containing more than 23,000 references of regularly updated circuit breakers. This catalog can be edited by the user. Schematics, created in **SEE Calculation**, can be exported to DXF format.

ADAPTABLE

Created for designers of electrical distribution systems for industrial and commercial buildings, **SEE Calculation** is used by both engineering firms and installers for new projects and maintenance for building owners. **SEE Calculation** adapts to the habits of each user. A custom configuration file allows different working preferences to be taken into account (brand equipment, maximum cable cross sections, presentation of published documents, etc.)

RELIABLE

SEE Calculation allows the user to choose from certified standard values. Operations are linked to ensure designs always adhere to the IEC 60364 standard rules. When the result of a calculation indicates non-compliance to the standards, the user is guided to the possible solutions.

SEE Calculation functions

Intuitive user interface

Simultaneous display of properties input dialog window and the system synoptic

Editable single-line diagram

Power requirement

Calculation note and summary

Multi-manufacturer catalogue containing more than 23,000 references

Add or change protection properties

Export Single-Line Schema to DXF (AutoCAD)

Export of circuit characteristics to a database manager or spreadsheet (Excel, Access)

Compatibility: Windows 7, Windows 8 in 32 bits and 64 bits versions

Possibility of installation on a computer network

Possibility of using Internet licensing

CALCULATION PARAMETERS TAKEN INTO ACCOUNT

Protection Selectivity

Protection Back-up

Back-up Source

CALCULATION CONDITION

Areas at risk of explosion (French factor BE3) (simplified factor)

International Standard IEC 60364

CENELEC TR 50-480

Calculation on a predetermined value of I_k

Calculation from Public utility supply (monitored power source)

Calculation for Residential Installation (limited power)

Single and multicore cables up to 630mm²

Conductors up to 630mm²

INSTALLATION

TN (TN-S et TN-C), IT, TT Earthing systems

Taking into account third order harmonics

Taking into account the symmetry factor

Types of circuits: cable, busbar trucking systems, mixed (Cable and Busbar), with transformer, with an UPS (Uninterruptible Power Supply), Motor.

CHARACTERISTICS

Supply voltage up to 1000V

Voltage drop Calculation with predefined maximum value

Help for problem solving

Calculation of reactive energy compensation

Copy / Paste from one installation to another
